PLCnext Technology Configuration and Engineering

Fast and flexible configuration

- C-Code, Simulink models, function components, IEC61131-3, Safety, HMI

Extendable

- By licensed add-ins like the Viewer for Simulink

Easy handling

- Intuitive user interface
- Clear structures

The software for configuration and engineering

PLCNEXT ENGINEER

Selección

PLCnext Engineer

The screenshot displays the Phoenix Contact website's product page for PLCnext Engineer. The header features the Phoenix Contact logo and a search bar. The main navigation menu includes 'Productos', 'Soluciones', 'Servicio y Soporte', and 'Mi Phoenix Contact'. The breadcrumb trail indicates the path: Home > Productos > Software industrial > Programación PLC > Lista de productos Programación con PLC. The product title is 'Software - PLCNEXT ENGINEER - 1046008'. A description states it is a software platform for automation control, compliant with IEC 61131-3, and available for free download. A 'Crear PDF' button is present. A note indicates that the product must be configured and delivered within 48 hours by email. The right sidebar contains a 'Comparativa de productos (4)' link and contact information for Phoenix Contact GmbH & Co. KG, including the address 'Flachsmarktstraße 8, D-32825 Blomberg' and the phone number '+49 (0) 5235-3 00'. At the bottom, there are buttons for 'Añadir a la comparativa', 'Añadir a la lista de notas', and 'Configurar', along with tabs for 'Vista general', 'Datos técnicos', 'Accesorios', and 'Descargas'.

PLCnext Engineer

- Licenses
 - Button Configure
 - Activation Wizard

1.5 PLCnext Engineer licenses

The basic functions of PLCnext Engineer are available as a free of charge license. Once installed, these functions are available without limitation and free of charge. Further functions can be added for a fee (even at a later stage). The licenses are bound to the hardware of a PC or a USB dongle.

To order further licenses, proceed as follows:

- Log in with your access data at phoenixcontact.net/products or register for the first time.
- Select the PLCNEXT ENGINEER product (Order No. 1046008).
- Select "Configure" on the PLCNEXT ENGINEER product page to configure your personal license.

Once you have sent your order, within 48 hours you will receive an email from Phoenix Contact that contains a ticket ID. You need the ticket ID to activate the license.

The Phoenix Contact Activation Wizard is used for the activation process of licenses for further functions. The Phoenix Contact Activation Wizard is a part of the PLCnext Engineer installation package. In order to start the application you will find an .EXE-file under the installation path (Default path: „C:\Program Files (x86)\PHOENIX CONTACT\Phoenix Contact Activation Wizard\“).

The USB dongle ESL STICK USB A (Order No. 1080084) for saving licenses for various software products is delivered without licenses. The Phoenix Contact Activation Wizard is also used for the activation process of USB dongle licenses.

- To activate a license, follow the instructions in the Phoenix Contact Activation Wizard.

“COMPONENTS” area

The “COMPONENTS” area contains all the components available for the project. The components can be divided into the following categories based on their function:

- Developing program code (“Data Types”, “Programs” and “Functions & Function Blocks”)
- Showing all devices available for the “PLANT” area and adding them via GSDML or FD-CML (“Devices”)
- Editing HMI pages (“HMI”)
- Adding libraries such as firmware libraries, IEC user libraries or libraries provided by Phoenix Contact (“References”)

Figure 3-4 Example for the “COMPONENTS” area

Add in

PLCnext Engineer

Sequential Function Chart Editor

Editor for programming the IEC 61131-3 compliant sequential function chart with integrated troubleshooting.

Application Control Interface

Interface for controlling the PLCnext Engineer software remotely from external high-level language applications.

Add in

PLCnext Engineer

Viewer for Simulink

Viewer for displaying MATLAB® Simulink® models that can be processed on a PLCnext Technology controller.

Functional Safety Editor

Editor (certified by TÜV Rheinland) for programming safety-related user applications and for configuring and starting up PROFIsafe devices on safety-oriented controllers with PLCnext Technology.

Add in

PLCnext Engineer

Safe - CFUNC

To create C function libraries and issue them with certificates.
These libraries can be sent to a safety controller, without having to update the controller's firmware.

GEN

HMI Generator

HMI Generator for generating a complete visualization based on a user project, without any manual effort.

Add in

PLCnext Engineer

Ethernet Topology View

To read in and display the connected Ethernet topology. The devices together with the network addresses, ports, and connection types can be displayed in various views.

PLCnext Engineer 1046008

Sequential Function Chart – SFC

- Represented as a function block
- Automatic generated TypeInfo and StateInfo structure
- Error handling
- Directly connected transitions
- Transitions in separate worksheets (FBD, ST, LD)
- Operation modes:
Automatic, Manual Step, Halted

Sequential Function Chart – SFC

- Compact SFC
- STEP Interlock
can be used to control the execution of actions associated to a step
- Pre-Execute worksheet
- Post-Execute worksheet

PLCnext Engineer

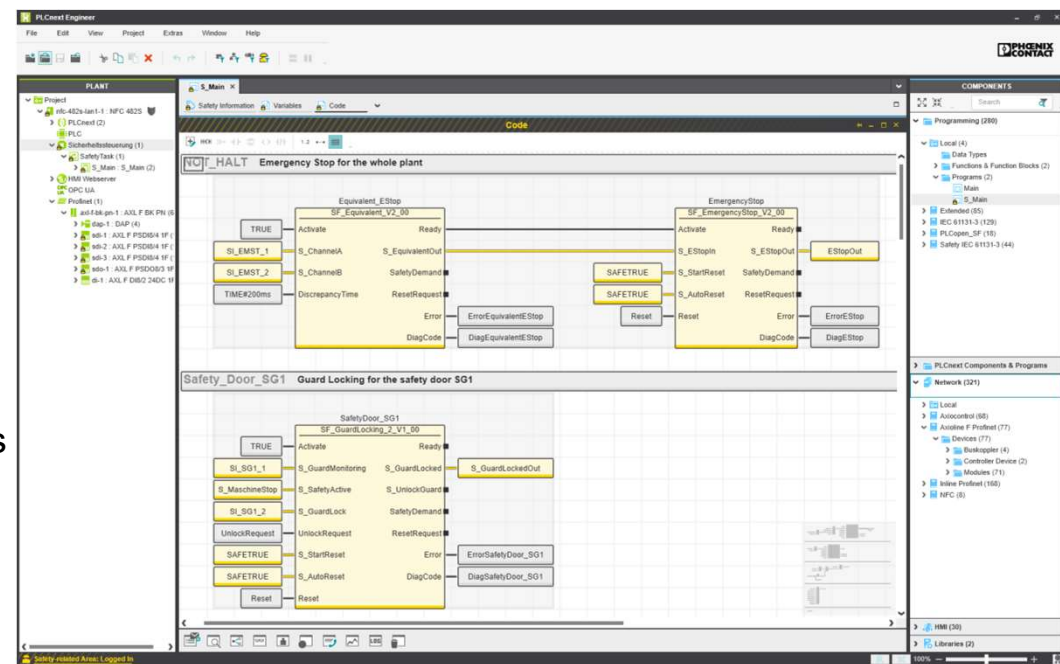

Functional Safety Programming

PLCnext Technology 
Designed by PHOENIX CONTACT

Fully integrated Safety Programming

- TÜV Rheinland certified according to IEC 61508
- Editor with common behavior as known from standard FBD or LD editor
- Low Variability Language support
- Network granular CRC checksums
- PROFIsafe Support

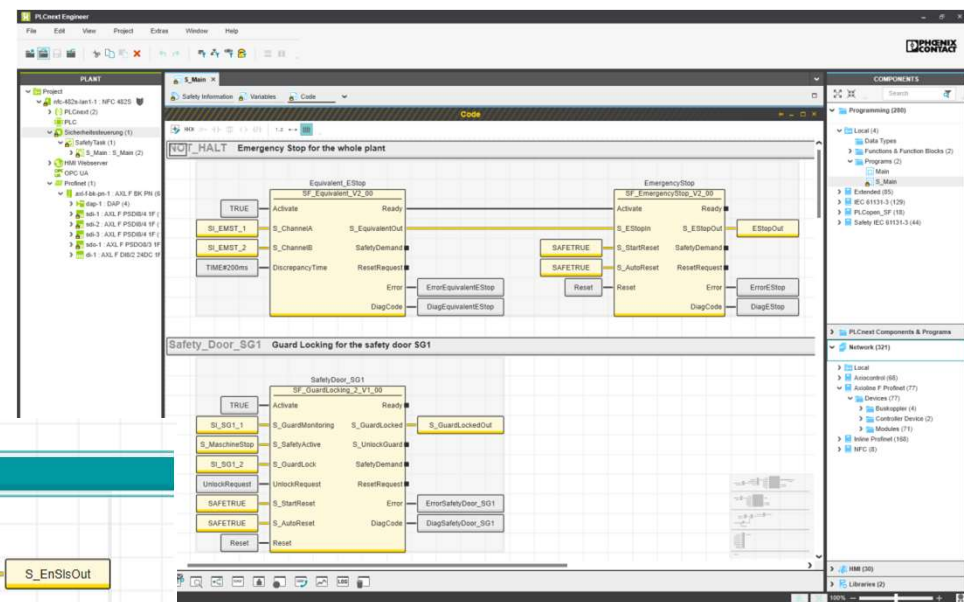

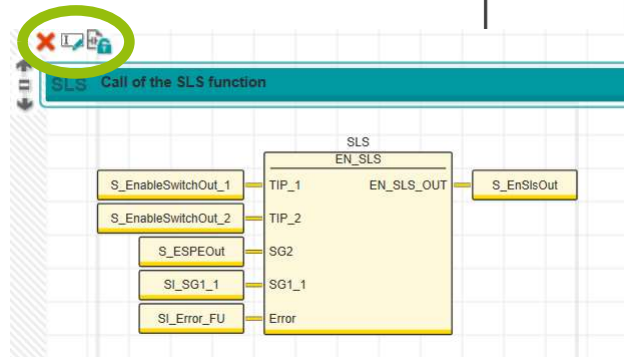

Functional Safety Programming

Fully integrated Safety Programming

- Individual safety functions can be protected by a verification function
- Background signal path analysis
- Background safe semantic analysis
- Diversely-redundant code generator

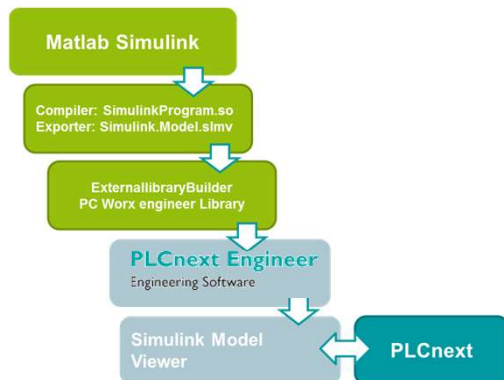

PLCnext Engineer

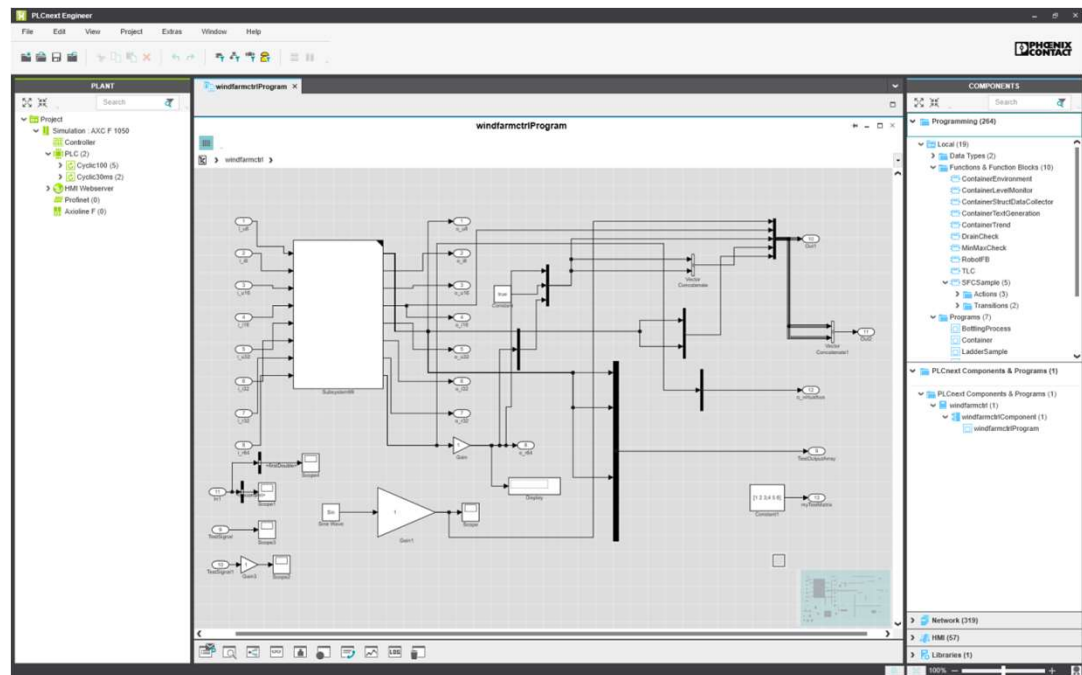

Viewer for Simulink

- Model export as part of a PLCnext library
- Drill-down into sub-models
- Online-values for In- and Out-Ports

PLCnext Technology 
Designed by PHOENIX CONTACT

PLCnext Engineer 2019.0

Viewer for Simulink

PLCnext Technology[®]
Designed by PHOENIX CONTACT

- Global / Local Search
 - Jumpable objects selected
- Display block with online values
- Overwrite of GDS ports
- Jump to Type Model from Instance
- Online Indication on lines for boolean in /out ports

Application Control Interface (ACI)

Remote Control of the software:

- ✓ Application.BuildPath (property)
- ✓ Application.OpenProject (method)
- ✓ Application.ProjectOpened (event)
- ✓ Project.Close (method)
- ✓ Project.Save (method)
- ✓ Project.SaveAs (method)
- ✓ Project.Closed (event)
- ✓

Overview

Technical data

Downloads

Product Description

Up to 2000 licenses with different license models for various software tools can be stored on the license dongle. Licenses can be used flexibly by moving the dongle from one computer to another. Use of a license dongle is recommended when using virtual machines. This means that licenses can still be used after virtual machines are copied or even if settings are changed on the virtual machine. Using the "Activation Wizard" software tool, activate and deactivate licenses on the license dongle. Or use the "Activation Wizard" to migrate licenses from a PC hard drive to a license dongle (or vice versa), for example. No additional drivers are required to operate the dongle. After it is connected to a computer, it can immediately be used without administrator rights.

LTS Version

Wikipedia:

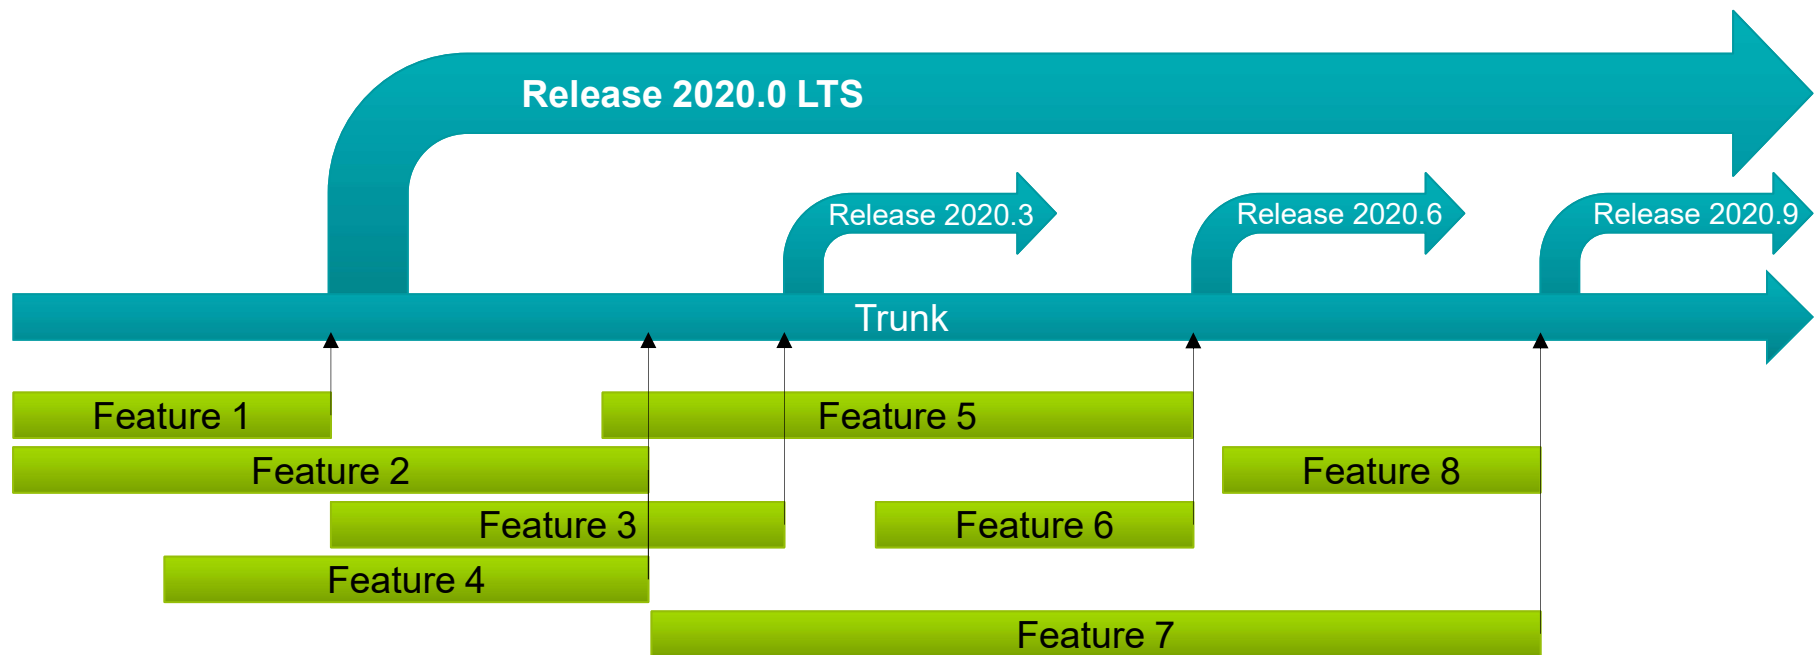

Long-term support (LTS) ...

... is a product lifecycle management policy in which a stable release of computer software is maintained for a longer period of time than the standard edition. The term is typically reserved for open-source software, where it describes a software edition that is supported for months or years longer than the software's standard edition.

Learning objectives:

- Get to know the "PLCnext Engineer" engineering tool
- Create a simple IEC program and run it on the PLC
- Getting to know troubleshooting possibilities

target group:

- PLC programmers with a basic knowledge of IEC61131

The new era of automation

PLCnext Technology – Python examples

Python examples

Agenda

- General introduction to Python
- Hello World project
- Installation of packages
 - Manual installation
 - Installation via PIP
- Example 1: Modbus TCP with Python
- Example 2: MQTT with Python
- Q&A

Python examples

General introduction to Python

- is an interpreted, high-level programming language
- supports object-oriented and structured programming
- was developed in the early 1990s by Guido van Rossum as a follow-up to the language ABC
- Python is ...
 - platform independent
 - characterized by its readability and shortness (for example by using spaces instead of curly brackets)
 - designed to keep the fun in programming and that's why the name "Python" was chosen as a tribute to the comedian group Monty Python
 - executed line by line and converted into low level machine code

Python examples

Python on PLCnext Control

- Python 3.8 is pre-installed on PLCnext Controls
- Pre-installed packages can be found in `/usr/lib/python3.8`
- Python code can be executed:
 - directly within the command line
 - as `*.py` script

...

Python examples

The image shows a terminal window titled 'admin@192.168.0.120' with the following output from the script 'Python_MQTT_Client_Test2.py':

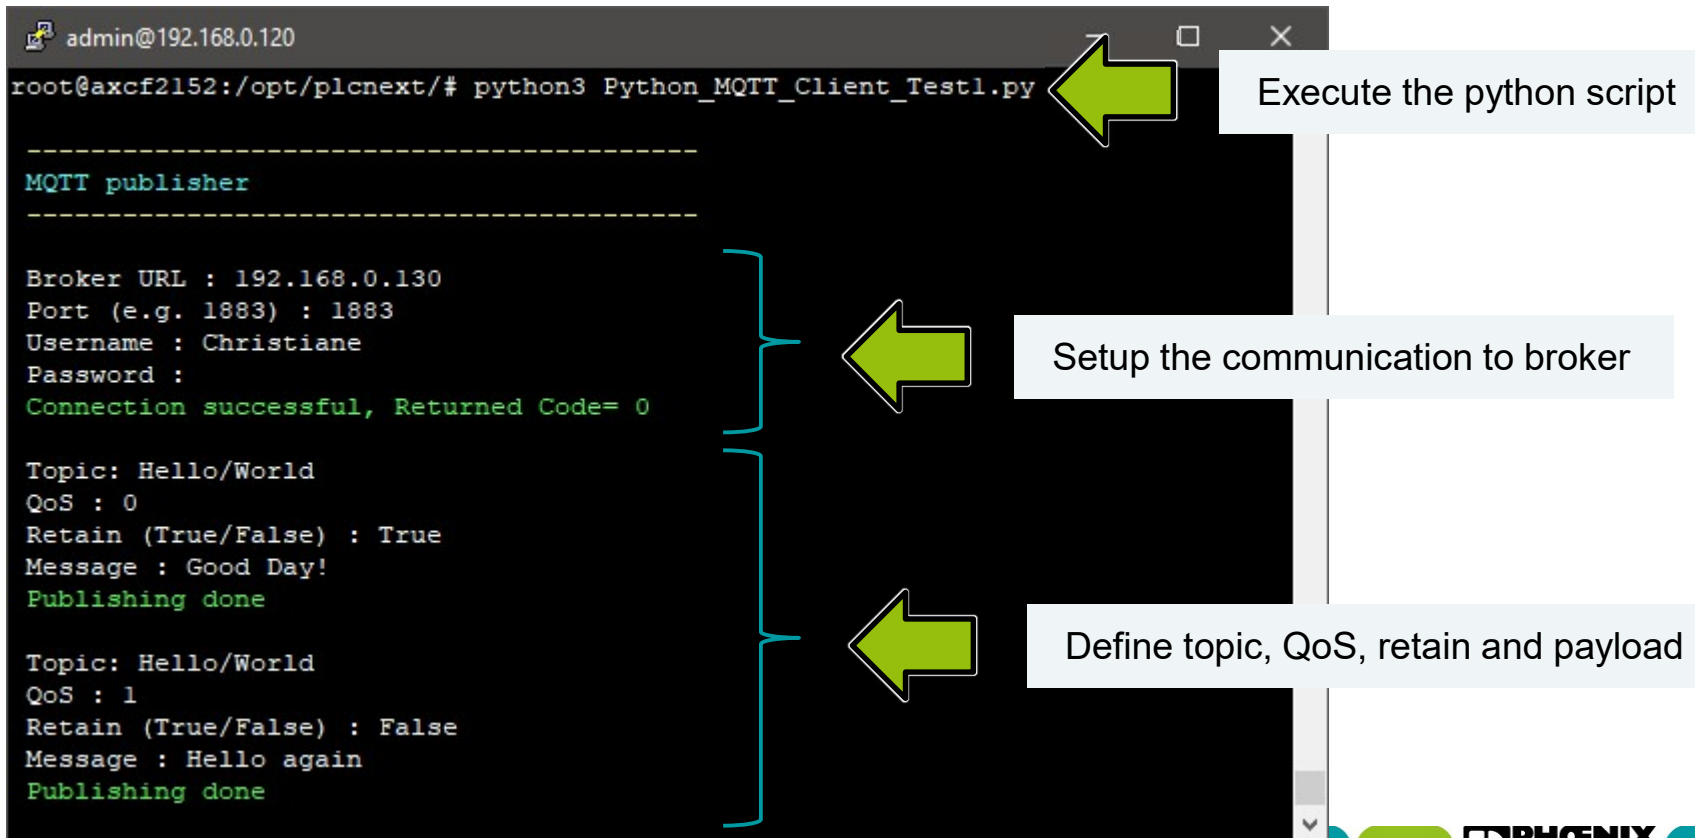

```
-----  
MQTT subscriber  
-----  
  
Broker URL : 192.168.0.130  
Port (e.g. 1883) : 1883  
Username : Christiane  
Password :  
Connection successful, Returned Code= 0  
Topic to subscribe : Hello/World  
QoS : 0  
Subscription done  
Waiting for data ...  
  
2020-11-11 10:03:53.337899  
Topic : Hello/World  
Message : b'Yeaaaahhhh'  
  
2020-11-11 10:04:14.177894  
Topic : Hello/World  
Message : b'Hello World 123'
```

Annotations with green arrows point to specific parts of the terminal output:

- Execute the python script**: Points to the command `python3 Python_MQTT_Client_Test2.py`.
- Setup the communication to broker**: Points to the broker configuration lines (Broker URL, Port, Username, Password).
- Define topic and quality of service level**: Points to the subscription configuration lines (Topic to subscribe, QoS).
- Value changes will be displayed, incl. time**: Points to the received messages, which include a timestamp and the message content.

At the bottom right, there is a logo for **PHOENIX CONTACT** with the tagline **INSPIRING INNOVATIONS**.

Python examples

The image shows a terminal window titled 'admin@192.168.0.120' with the command `python3 Python_MQTT_Client_Test1.py` executed. The output is divided into three sections by blue brackets on the right, each with a green arrow pointing to it from a text box:

```
-----  
MQTT publisher  
-----  
  
Broker URL : 192.168.0.130  
Port (e.g. 1883) : 1883  
Username : Christiane  
Password :  
Connection successful, Returned Code= 0  
  
Topic: Hello/World  
QoS : 0  
Retain (True/False) : True  
Message : Good Day!  
Publishing done  
  
Topic: Hello/World  
QoS : 1  
Retain (True/False) : False  
Message : Hello again  
Publishing done
```

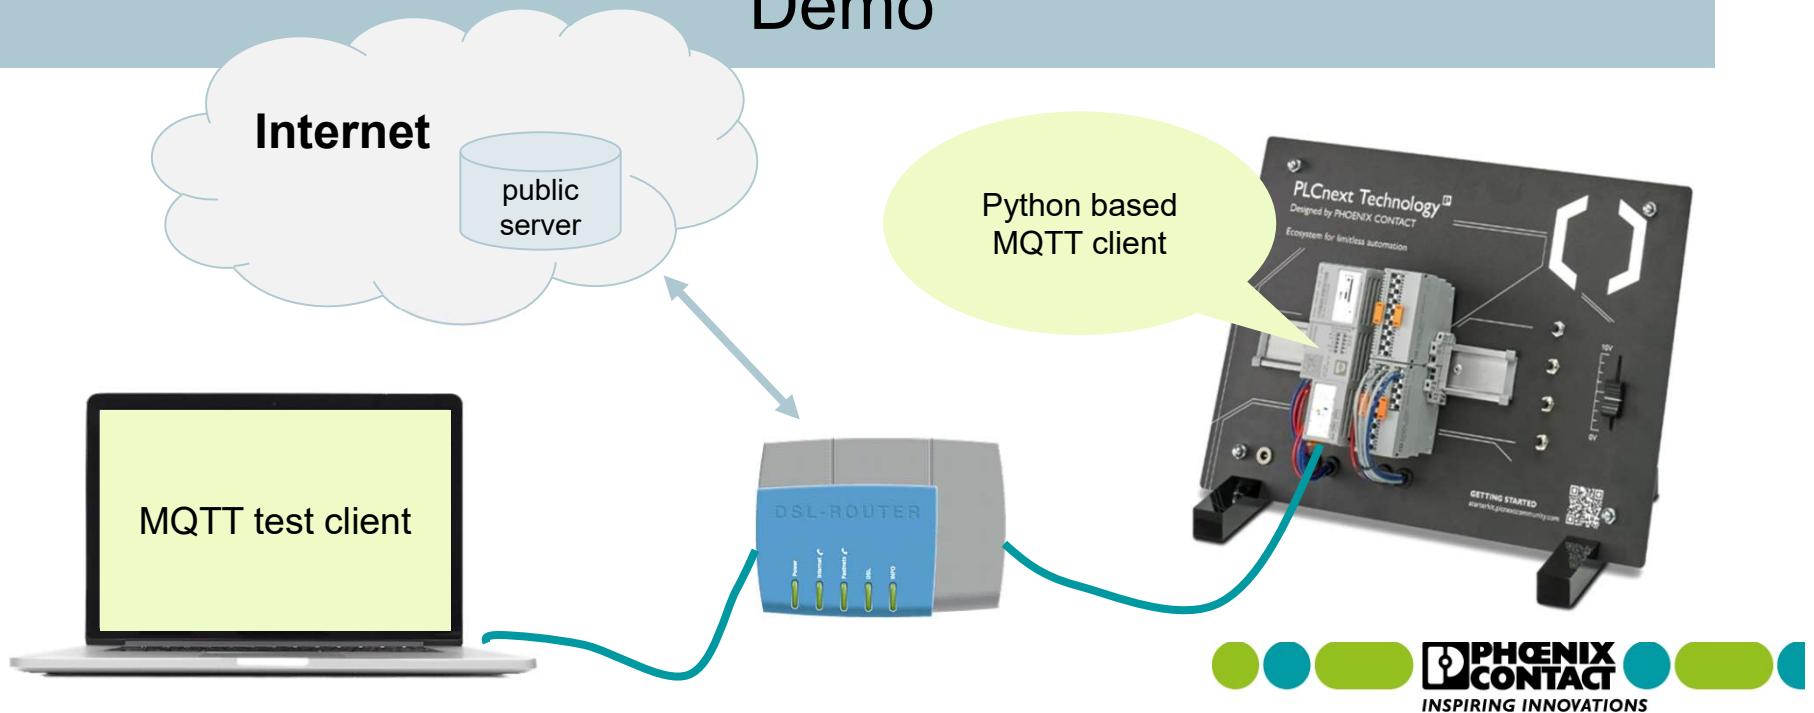

Annotations:

- Execute the python script**: Points to the command line.
- Setup the communication to broker**: Points to the connection parameters (Broker URL, Port, Username, Password).
- Define topic, QoS, retain and payload**: Points to the publishing details (Topic, QoS, Retain, Message).

32
33         // setup project config here
34     }
35 }
```

COMP_SimpleAnd.cpp

C++ Components

Project creation

Demo

C++ Components

Demo 1: Project creation

Create a new C++ project and use the following names in it:

Project name: Proj_AddTwoValues

Component name: COMP_AddTwoValues

Program name: PG_AddTwoValues

Project namespace: LIB_AddTwoValues

C++ Components

Real-time execution via user programs

Demo

Demo 2: Real-time execution via user programs

1. Program within the user program that two values provided via ports can be added. The result should be provided by the C++ program.
2. Save and compile the project.
3. Insert the created library into your PLCnext Engineer project.
4. Call the program within a cyclic task and assign the ports.
5. Download the project to the PLCnext Control and check whether the result can be calculated correctly.
6. Then switch back to your C++ project, open the component files and gain an overview about the content therein.

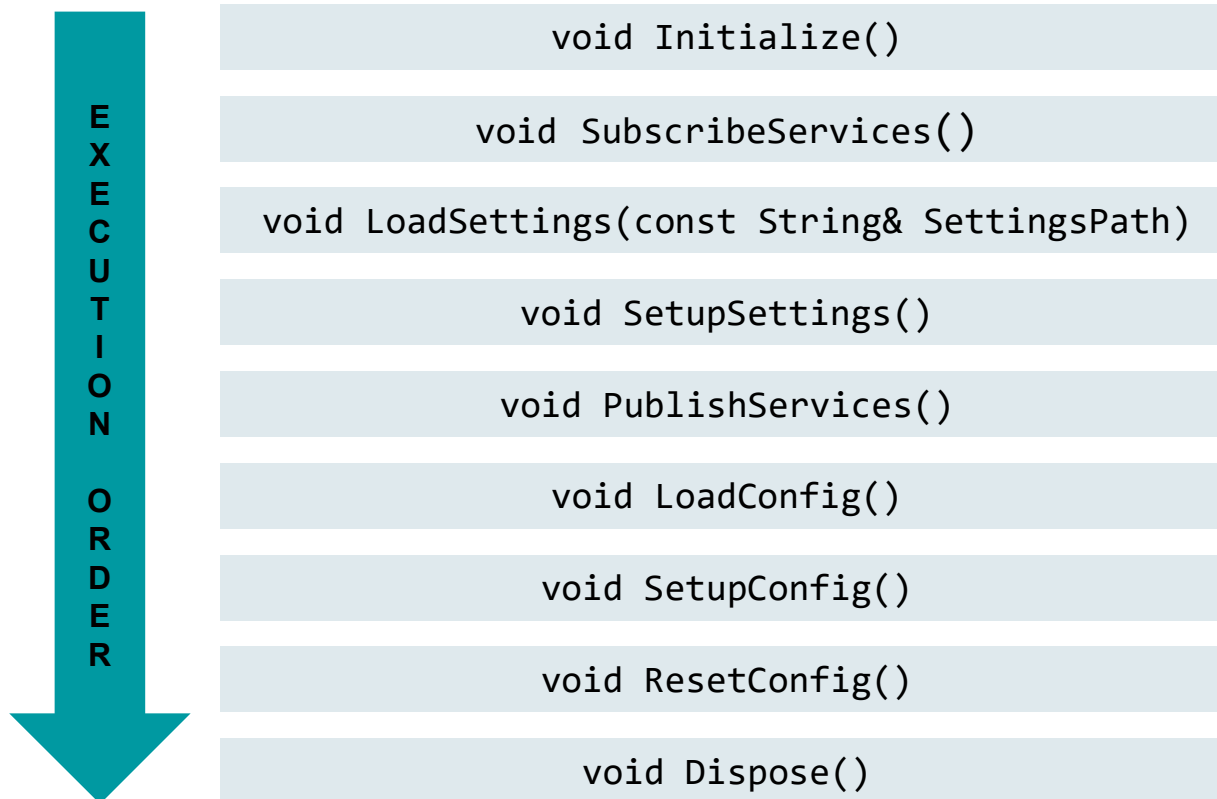

C++ Components

Agenda

- General introduction
- Required software for C++ Programming
- C++ project structure
- C++ Component functions
- C++ Worker thread
- C++ Component interfaces (GDS ports)
- C++ Component instantiation
- C++ Remote Service Calls (Overview)

C++ Components

Pre-defined functions

C++ Components

Pre-defined functions

Demo

Demo 3: Pre-defined functions

1. Look at the functions declared in the component header file template. Add "Dispose".
2. Change to the **.cpp* file of the component. Place a programming here, which creates a different log file entry in each function.
3. Save and compile the C++ project.
4. Download the synchronized PLCnext Engineer project to the PLCnext Control.
5. Establish an SFTP connection, e.g. via WinSCP and open the log file.
6. Analyze the order and number of calls of the C++ functions. Also restart the firmware processes via command-line (`sudo /etc/init.d/plcnext restart`) and see which function is called when.

C++ Components

Agenda

- General introduction
- Required software for C++ Programming
- C++ project structure
- C++ Component functions
- C++ Worker thread
- C++ Component interfaces (GDS ports)
- C++ Component instantiation
- C++ Remote Service Calls (Overview)

C++ Components

Worker thread

Demo

Demo 4: Worker thread

1. Include the needed header for working with worker threads within the header file.
2. Add the namespace as used namespace within this project.
3. Create a function declaration for the thread function to be processed cyclically.
4. Declare an instance name for the thread.
5. Save your changes and open the `*.cpp` file. Here configure the thread.
6. The thread must be started with the call of “LoadConfig” and stopped with “ResetConfig”.
7. Add the thread function and program that a log file entry can be created cyclically.
8. Save and compile the C++ project. Then send the PLCnext Engineer project to the PLC.
9. Now open the log file and check whether you can see the log entries.

C++ Components

Agenda

- General introduction
- Required software for C++ Programming
- C++ project structure
- C++ Component functions
- C++ Worker thread
- C++ Component interfaces (GDS ports)
- C++ Component instantiation
- C++ Remote Service Calls (Overview)

C++ Components

Port definition within the header file

```
COMP_SimpleAnd.hpp
45
46 public: /* Ports
47 =====
48 Component ports are defined in the following way:
49
50     // #attributes(Hidden)
51     struct Ports
52     {
53         // #name(NameOfPort)
54         // #attributes(Input|Retain|Qpc)
55         App::boolean portField = false;
56         // The GDS name is "<componentName>/NameOfPort" if the struct is declared as Hidden
57         // otherwise the GDS name is "<componentName>/PORTS.NameOfPort"
58     };
59
60     // #port
61     Ports ports;
62
63     Create one (and only one) instance of this struct.
64     Apart from this single struct instance, there must be no other Component variables declared with the #port comment.
65     The only attribute that is allowed on the struct instance is "Hidden", and this is optional.
66     The struct can contain as many members as necessary.
67     The #name comment can be applied to each member of the struct, and is optional.
68     The #name comment defines the GDS name of an individual port element. If omitted, the member variable name is used as the GDS name.
69     The members of the struct can be declared with any of the attributes allowed for a Program port.
70 */
71 };
```

Exemplary port configurations

```
public:

    // #attributes(Hidden)
    struct Ports
    {
        // #name(OUTPORT_xLED)
        // #attributes(Output|Opc)
        Arp::boolean LED = false;
    };

    // #port
    Ports ports;
```

LED is used as variable name within the C++ code,
but **OUTPORT_xLED** is the port name

```
public:

    // #attributes(Hidden)
    struct Ports
    {
        // #attributes(Output|Opc)
        Arp::boolean OUTPORT_xLED = false;
    };

    // #port
    Ports ports;
```

OUTPORT_xLED is to be
used in the code and as port name

C++ Components

C++ Component ports

Demo

Demo 5: C++ Component ports

1. Open the **.hpp* file again. Here, create a component port structure with three input port elements (two for the summands, one for the result)
2. Save the changes and open the **.cpp* file of the component. Then insert a programming for the worker thread function. The function should make it possible that whenever the result value changes, the new equation is written to the log file.
3. Save and compile the C++ project.
4. The port assignment can be done within the general port list in PLCnext Engineer.
5. Save and download the project to the PLC.
6. Change the summands several time, e.g. via overwrite in debug mode, and check whether the corresponding entries appear in the log file.

Manual GDS configuration for Component Ports (1)

- Custom GDS file can be stored anywhere on the PLC but must be linked in the default GDS configuration file

→ `/opt/plcnext/projects/Default/Plc/Gds/Default.gds.config`

```
<?xml version="1.0" encoding="utf-8" ?>
<GdsConfigurationDocument
  xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
  xmlns:xsd="http://www.w3.org/2001/XMLSchema"
  xmlns="http://www.phoenixcontact.com/schema/gdsconfig"
  schemaVersion="1.0" >

  <Includes>
    <Include path="$ARP_PROJECT_CURRENT_DIR$/Plc/Gds/*.gds.config" />
    <Include path="/opt/plcnext/projects/SimpleAnd/SimpleAnd.gds.config" />
  </Includes>
</GdsConfigurationDocument>
```

Manual GDS configuration for Component Ports (2)

- Custom GDS configuration needs to be done in XML

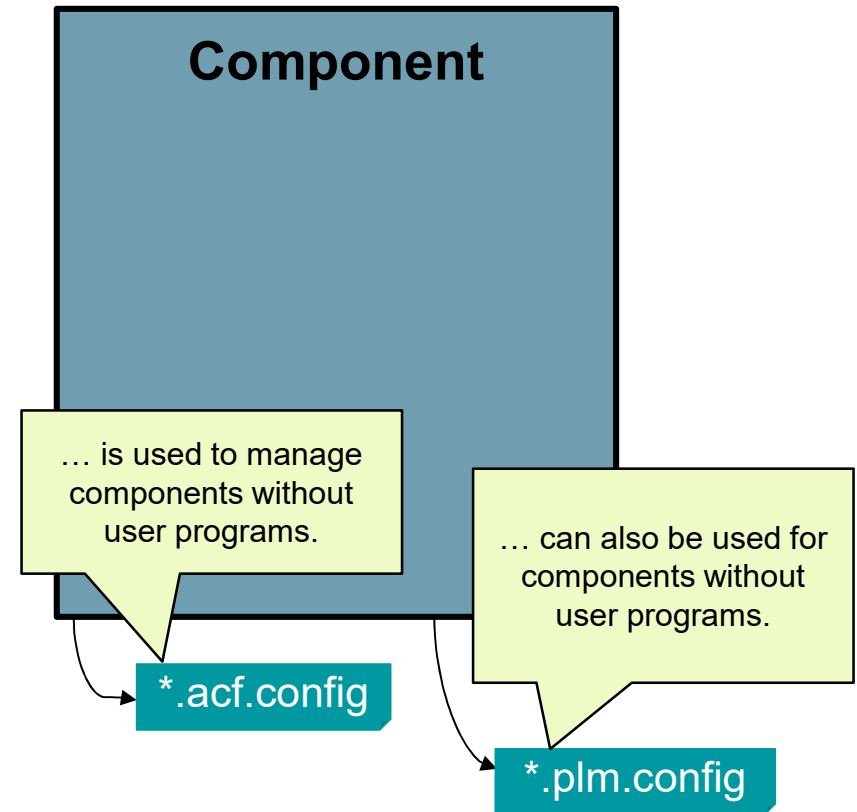

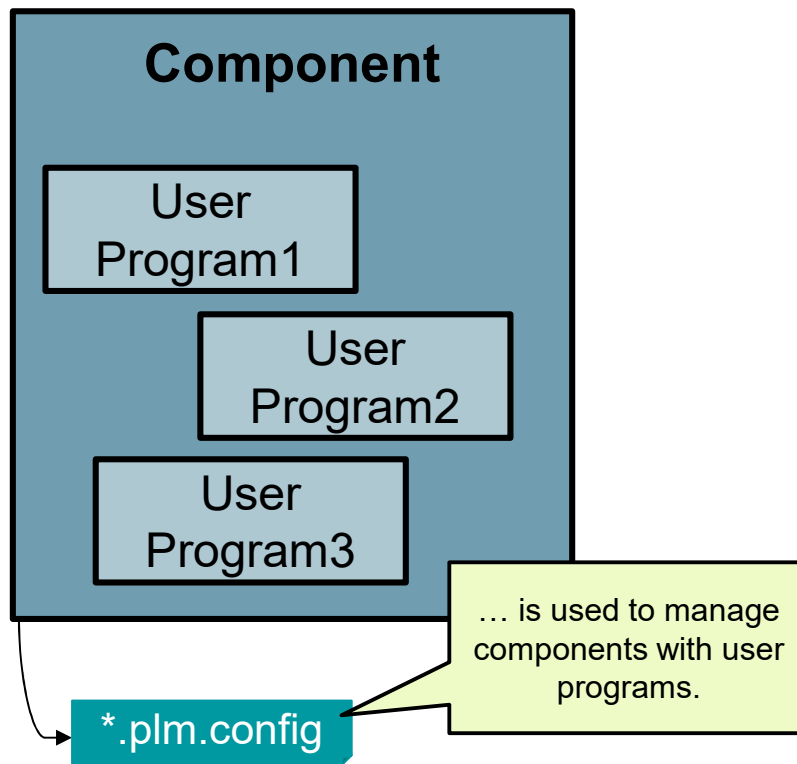

```
<?xml version="1.0" encoding="utf-8" ?>
<GdsConfigurationDocument xmlns:xsd="http://www.w3.org/2001/XMLSchema"
    xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance" schemaVersion="1.0"
    xmlns="http://www.phoenixcontact.com/schema/gdsconfig">
  <ComponentTaskRelations />
  <Connectors>
    <Connector startPort="Arp.Io.Ax1C/0.IN00" endPort="COMP_SimpleAnd_Test1/INPORT_xVar1" />
    <Connector startPort="Arp.Io.Ax1C/0.IN01" endPort="COMP_SimpleAnd_Test1/INPORT_xVar2" />
    <Connector startPort="COMP_SimpleAnd_Test1/OUTPORT_xResult" endPort="Arp.Io.Ax1C/0.OUT00" />
  </Connectors>
</GdsConfigurationDocument>
```

C++ Components

Agenda

- General introduction
- Required software for C++ Programming
- C++ project structure
- C++ Component functions
- C++ Worker thread
- C++ Component interfaces (GDS ports)
- C++ Component instantiation
- C++ Remote Service Calls (Overview)

Component instantiation

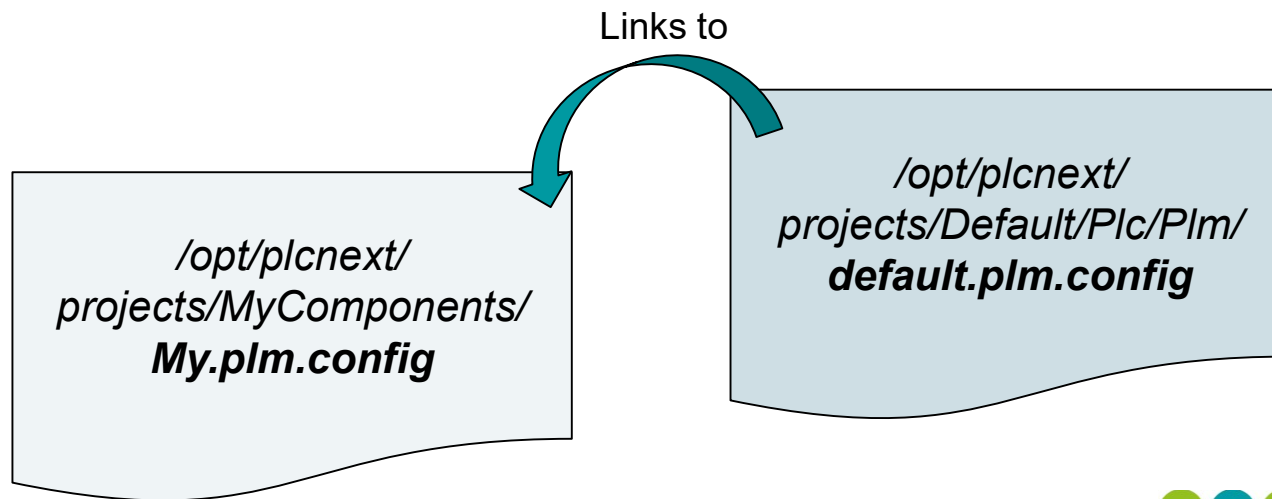

Comparison of PLM and ACF instantiation

Program Library Manager (PLM)	Application Component Framework (ACF)
Both use XML as language within the configuration file, and the XML structure is very similar	
Only components managed by the PLM can also provide programs that can be instantiated in ESM tasks	ACF components can <u>not</u> provide user programs.
Only components that are managed by the PLM can be stopped, changed and started by downloading from the PLCnext Engineer. This also applies to ESM tasks and the programs instantiated therein.	For components managed by the ACF, the firmware must be stopped, started, or restarted. So, components managed by the ACF will persist even if the PLC program is stopped, deleted or started.
Access to the GDS can be done by using ports.	

Manual PLM configuration files

- Custom PLM file can be stored anywhere on the PLC but must be linked within the default PLM configuration file
- **Example:**

C++ Components

ACF configuration files

→ */opt/plcnext/projects/Default/<constum name>.acf.config*

```
<?xml version="1.0" encoding="UTF-8"?>
<AcfConfigurationDocument
  xmlns="http://www.phoenixcontact.com/schema/acfconfig"
  xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
  xsi:schemaLocation="http://www.phoenixcontact.com/schema/acfconfig.xsd"
  schemaVersion="1.0" >
  <Processes>
    <Process name="Proj_RSC_ServicesProcess" settingsPath="$ARP_ACF_SETTINGS_FILE$" />
  </Processes>
  <Libraries>
    <Library name="LIB_RSC_Services.Proj_RSC_ServicesLibrary" binaryPath="/opt/plcnext/projects/MyComponents/libProj_RSC_Services.so" />
  </Libraries>
  <Components>
    <Component name="COMP_RSC_Services1" type="LIB_RSC_Services::COMP_RSC_Services"
      library="LIB_RSC_Services.Proj_RSC_ServicesLibrary" />
  </Components>
</AcfConfigurationDocument>
```

C++ Components

Creation of an ACF Component

Demo

Demo 6: Creation of an ACF component

1. Create a new C++ project, but now choose „PLCnext ACF project“ as project template.

2. Use the following names:

Project name: Proj_RscServices

Component name: COMP_RscServices

Project namespace: RscServices

3. Then create a worker thread like before for the PLM component.

4. Save and compile the project.

5. Copy the shared object (*.so) and the adjusted ACF configuration file to the PLC.

6. Restart the PLCnext processes via command.

7. Open the log file to check if the ACF component and the worker thread can be executed .

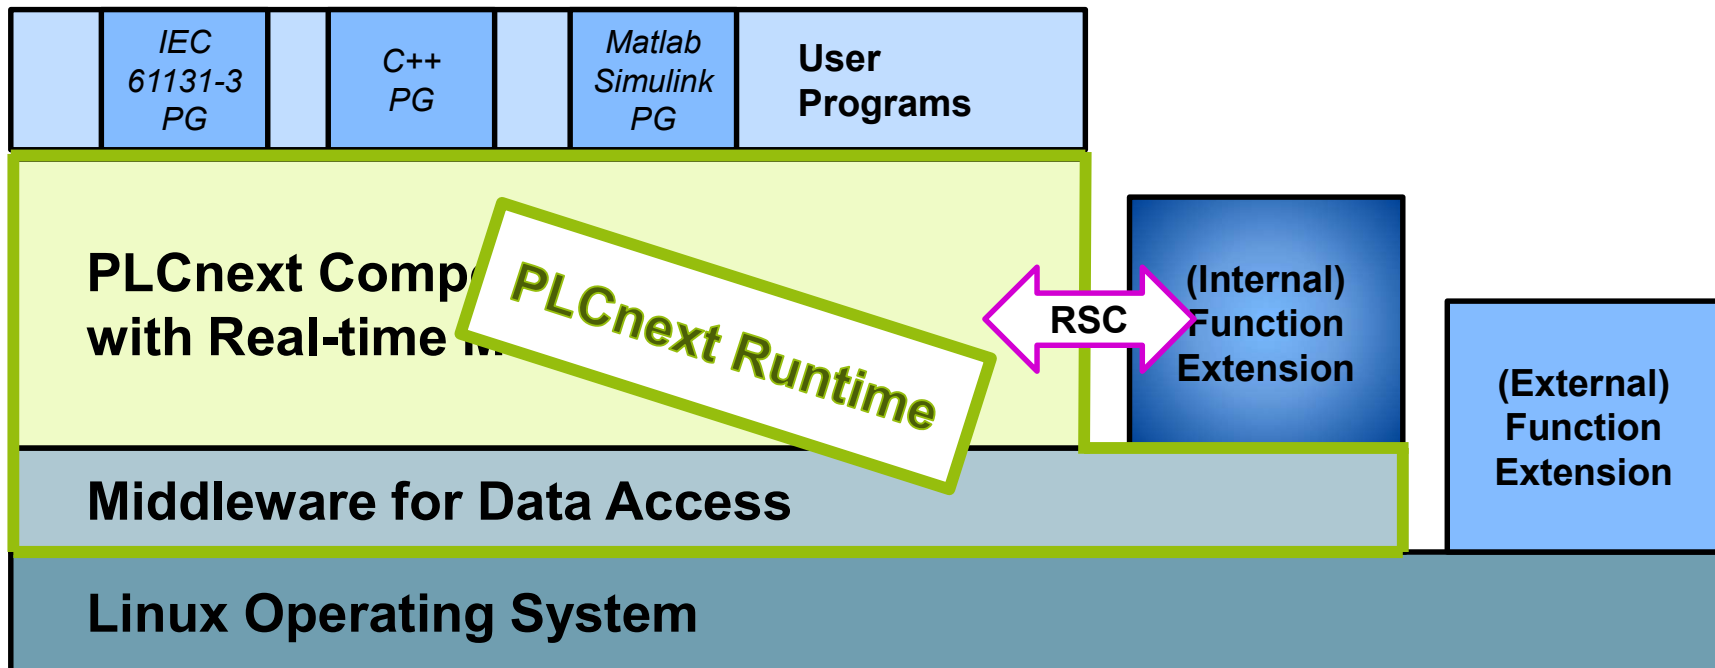

C++ Components

Agenda

- General introduction
- Required software for C++ Programming
- C++ project structure
- C++ Component functions
- C++ Worker thread
- C++ Component interfaces (GDS ports)
- C++ Component instantiation
- C++ Remote Service Calls (Overview)

C++ Components

Remote Service Calls (RSC services)

C++ Components

Services

Service	Namespace	Functions
IAcyclicCommunicationService	Arp/Io/ Axioline /Services	PdiRead, PdiWrite
IAcyclicCommunicationService	Arp/Io/ ProfinetStack /Controller/Service	RecordRead, RecordWrite
IDeviceInfoService	Arp/ Device /Interface/Services	GetItem, GetItems
IDeviceStatusService	Arp/ Device /Interface/Services	GetItem, GetItems
IDataAccessService	Arp/Plc/ Gds /Services	Read, ReadSingle, Write, WriteSingle

C++ Components

RSC service for Axioline

Demo

Demo 7: RSC services for Axioline

1. Open the header file of this ACF component and include the needed header file.
2. Add the namespace for the RSC service manager as used namespace.
3. Define variables:

```
Arp::Io::Axioline::Services::IAcyclicCommunicationService::Ptr pAxioAcyclicCommunicationService;  
Arp::Io::Axioline::Services::PdiParam AxioPdiParameters;  
std::vector<uint8> vAxioPdiData;  
bool xProductNameWritten = false;
```
4. Save the changes and open the **.cpp* file. Here, subscribe the RSC service and read the **product name**. The result of this read process has to be written to the log file.
5. Save and compile the C++ project.
6. Overwrite the shared object on the PLC
7. Restart the firmware processes and check if you can see the product name in the log file.

C++ Components

Demo 7: RSC services for Axioline

Manual for AXL F DI8/1 DO8/1 1H : 8670_en_03

0008	SerialNo	Var	Visible String	1	11	R	Serial number	xxxxxxxx (e.g., ...)

Diagnostics state (0018_{hex}: DiagState)

This object is used for a structured message of an error.

0018 _{hex} : DiagState (Read)				
Subindex	Data type	Length in bytes	Meaning	Contents
0	Record	8	Diagnostic state	Complete diagnostics information
1	Unsigned 16	2	Error number	0 ... 65535 _{dec}
2	Unsigned 8	1	Priority	00 _{hex} No error
				01 _{hex} Error
				02 _{hex} Warning
				81 _{hex} Error removed
3	Unsigned 8	1	Group	82 _{hex} Warning eliminated
				00 _{hex} No error
4	Unsigned 16	2	Error code	FF _{hex} entire device
				See table below
5	Unsigned 8	1	More information follows	00 _{hex} (not supported)
6	Visible String	1	Text	00 _{hex} (not supported)

C++ Components

RSC service for Profinet

Demo

Demo 8: RSC services for Profinet

1. Open the header file of the ACF component and include the needed header file.
2. Define variables:

```
Arp::Io::ProfinetStack::Controller::Services::IAcyclicCommunicationService::Ptr pPnioAcyclicCommunicationService;  
Arp::Io::ProfinetStack::Controller::Services::RecordParam PnioRecordParameters;  
std::vector<uint8> vPnioRecordData;  
bool xPnioDiagDataWritten = false;
```

3. Save the changes and open the *.cpp file. Here, subscribe the RSC service and read the **PN diagnostic data**. The result of this read process has to be written to the log file.
4. Save and compile the C++ project.
5. Overwrite the shared object on the PLC
6. Restart the firmware processes and check if you can see the data in the log file.

C++ Components

Demo 8: RSC services for Profinet

Manual for AXL F BK PN : 105731_en_05

The diagnostic status register can be read using asynchronous services (index 2210_{hex}, 8720_{hex}).

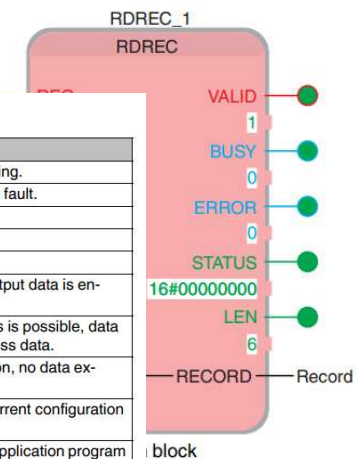

The diagnostic status register is located in byte 0 and byte 1. In the example, the following response is stored in variable RECORD:

Record	
[1]	16#00
[2]	16#E0
[3]	16#00
[4]	16#00
[5]	16#00
[6]	16#00
[7]	16#00
[8]	16#00
[9 ... 15]	16#00

In this example, the diagnostic status register has the value 00E0_{hex} (0000 0000 1110 0000_{bin}). Bits 5, 6, and 7 are TRUE. This means that data cycles are being exchanged, the configuration is active, and the local bus master is ready.

Structure of the diagnostic status register

Bit	Designation	Meaning	
00	F_PW_BIT	I/O warning	At least one device indicates an I/O warning.
01	F_PF_BIT	Peripheral fault	At least one device indicates a peripheral fault.
02	F_BUS_BIT	Bus error	A bus error has occurred.
03	-	Reserved	
04	-	Reserved	
05	F_RUN_BIT	Run	Data cycles are being exchanged, the output data is enabled.
06	F_ACTIVE_BIT	Active	Configuration is active, PDI to the devices is possible, data exchange with invalid/non-enabled process data.
07	F_READY_BIT	Ready	The local bus master is ready for operation, no data exchange over the bus.
08	F_BD_BIT	Bus different	A device which does not belong to the current configuration has been detected at the last interface.
09	F_BASP_BIT	SYS_FAIL	The controller is in the STOP state or no application program has been loaded. The output data is blocked (substitute value behavior is active).
10	F_FORCE_BIT	Force Mode	Force mode (startup tool/I/O check is active).
11	F_SYNC_BIT	Synchronization	Synchronization between higher-level system and local bus master has failed.
12	F_PARA_REQ	Module error	At least one device is requesting parameters.
13 ... 15	-	Reserved

C++ Components

RSC services for device interface data

Demo

Demo 9: RSC services for device interface data

1. Open the header file of the ACF component and include the needed header file.
2. Define the needed variables:

```
Arp::Device::Interface::Services::IDeviceInfoService::Ptr pDeviceInfoService;  
RscString<512> Parameter;  
RscVariant<512> DeviceInterfaceServiceData;  
bool xDeviceInterfaceDataWritten = false;
```

3. Save the changes and open the *.cpp file. Here, subscribe the RSC service and read the **firmware status**. The result of this read process has to be written to the log file.
4. Save and compile the C++ project.
5. Overwrite the shared object on the PLC
6. Restart the firmware processes and check if you can see the firmware in the log file.

C++ Component

Demo 9: RSC services for device interface data

The following parameters are available in the **IDeviceInfoService** RSC interface for calling of information:

Parameter	Data type	Description
General.DeviceClass	UInt32	The DeviceClass parameter specifies the device class. At the moment, only "ProgrammableLogicController" is supported. 0: Undefined 1: ProgrammableLogicController 2: BusCoupler 3: Switch
General.VendorName	String	The VendorName parameter indicates the name of the manufacturer.
General.ArticleName	String	The ArticleName parameter indicates the device name.
General.ArticleNumber	String	The ArticleNumber parameter indicates the order number of the device.
General.SerialNumber	String	The SerialNumber parameter indicates the serial number of the device.
General.Firmware.Version	String	The FirmwareVersion parameter indicates the firmware version of the device. Here, the 5-level notation (Major, Minor, Patch, Build, Status) is used.
General.Firmware.VersionMajor	Byte	The firmware version year is indicated without the first two digits. E.g., "2019" is indicated as "19".
General.Firmware.VersionMinor	Byte	FirmwareVersionMinor
General.Firmware.VersionPatch	Byte	FirmwareVersionPatch
General.Firmware.VersionBuild	UInt32	FirmwareVersionBuild
General.Firmware.VersionStatus	String	FirmwareVersionStatus
General.Firmware.BuildDate	String	FirmwareBuildDate ISO 8601 format <YYYY>-<MM>-<DD>
General.Firmware.BuildTime	String	FirmwareBuildTime ISO 8601 format <hh>:<mm>:<ss>
General.Hardware.Version	String	The HardwareVersion parameter indicates the hardware version of the device.
General.FPGA.Version	String	The FPGAVersion parameter indicates the FPGA version of the device. Here, the 3-level notation (Major, Minor, Patch) is

C++ Components

RSC service for GDS access

Demo

Demo 10: RSC services for GDS access

1. Open the header file of the ACF component and include the needed header file.
2. Define the needed variables:

```
Arp::Plc::Gds::Services::IDataAccessService::Ptr pDataAccessService;  
RscString<512> PortName;  
Arp::Plc::Gds::Services::ReadItem PortData;  
Arp::Plc::Gds::Services::ReadItem prevPortData;
```
3. Save the changes and open the *.cpp file. Here, subscribe the RSC service and read the **result of the add operation**. The result has to be written to the log file.
4. Save and compile the C++ project.
5. Overwrite the shared object on the PLC
6. Restart the firmware processes and check if you can see the result in the log file.

PLCnext DataLogger configuration parameters explained | PLCnext Technology

PLCnext Technology limitless Automation

Tools

- Node RED
- MQTT
- DOCKER

Node RED

The new era of automation

PLCnext Technology – MQTT examples

C++ Components

Agenda

- General introduction to MQTT
- MQTT with Node-RED
 - Subscribe data from a public broker
 - Publish data to a public broker
- MQTT with Python
 - Installation of the paho-mqtt library
 - Subscribe data from a public broker
 - Publish data to a public broker
- MQTT in IEC61131 (preview)
- PLCnext Control as MQTT broker
- Q&A

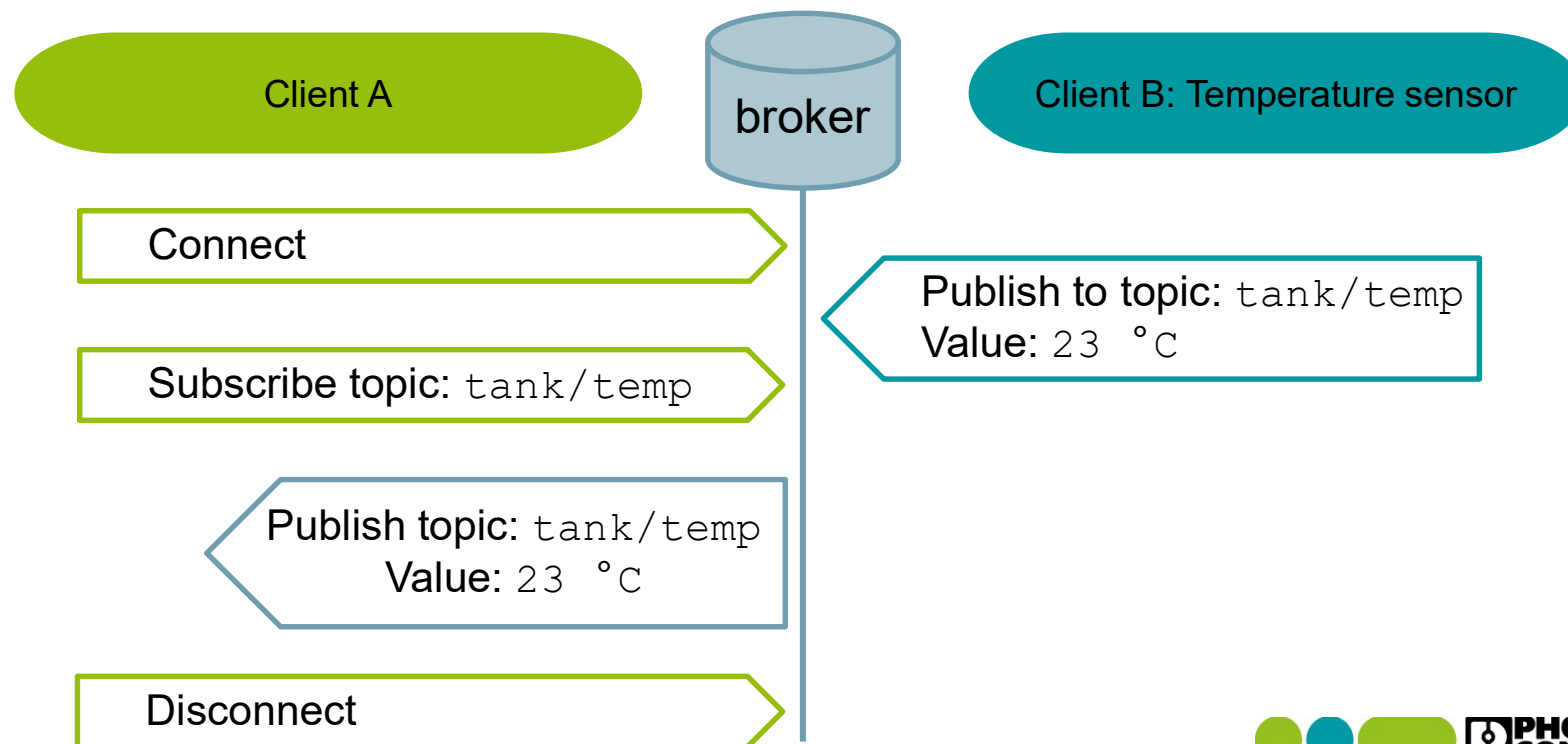

MQTT examples

MQTT (Message Queuing Telemetry Transport)

- TCP/IP message protocol for machine-to-machine communication
- Published in 1999 by IBM
- Standard since 2014
- Uses a publish-subscribe messaging pattern
- Client connects to a server which is called „broker“
- Client can publish or subscribe information
- The broker distributes a message to any client with a subscription.

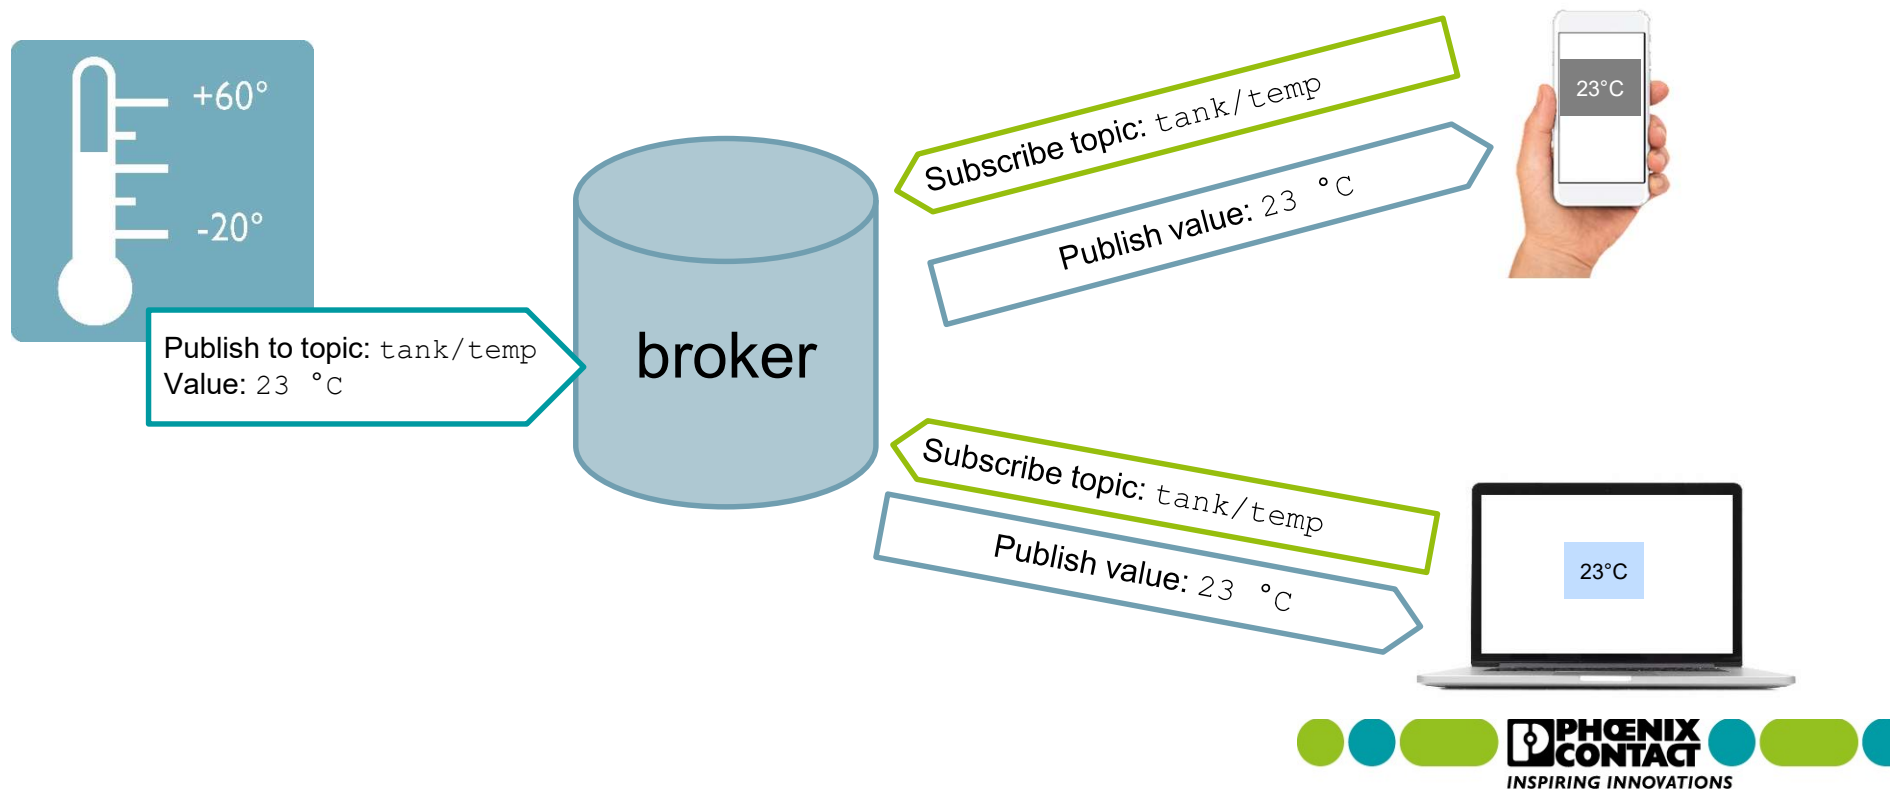

MQTT examples

Example of an MQTT connection

MQTT examples

Multiple subscriptions

MQTT examples

Quality of Service (QoS)

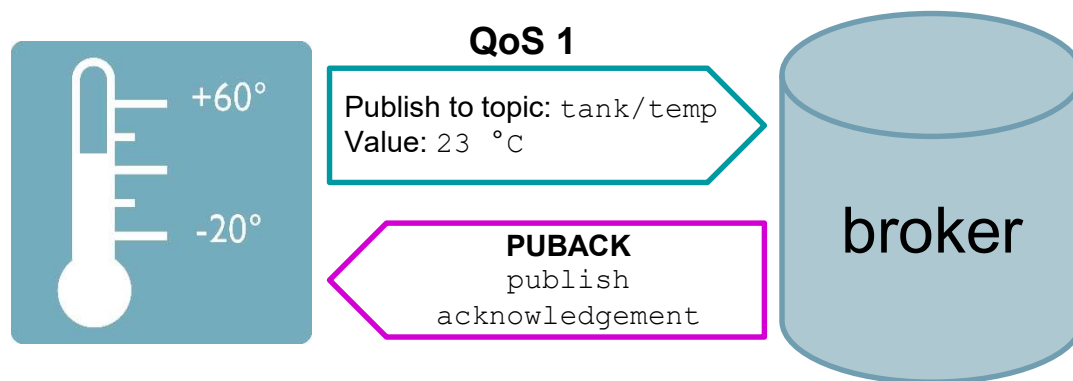

- Determines how the message is sent
 - 0: „at most once“ → message is sent without acknowledgement of the receiver

MQTT examples

Quality of Service (QoS)

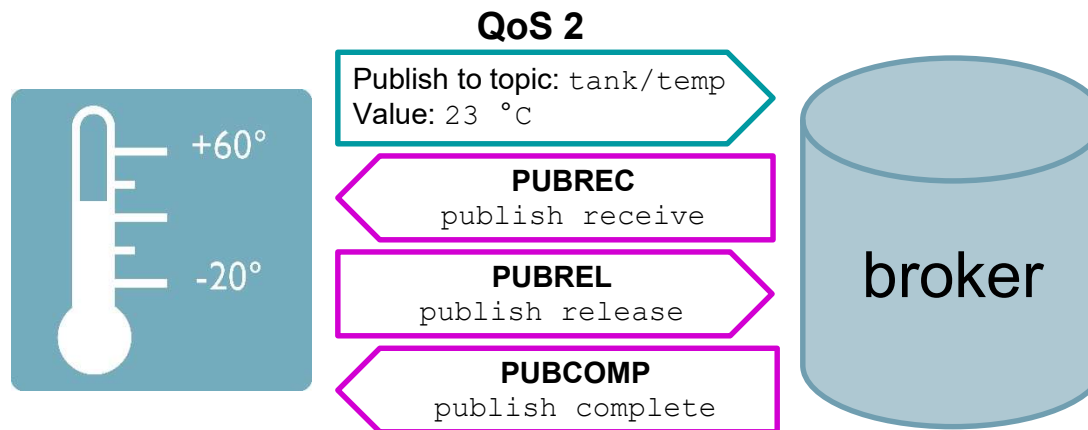

- Determines how the message is sent
 - 0: „at most once“ → message is sent without acknowledgement of the receiver
 - 1: „at least once“ → message is sent at least once, with acknowledgement

MQTT examples

Quality of Service (QoS)

- Determines how the message is sent
 - 0: „at most once“ → message is sent without acknowledgement of the receiver
 - 1: „at least once“ → message is sent once, with acknowledgement
 - 2: „exactly once“ → 2-level handshake between sender and receiver to ensure that only one message is received

C++ Components

Agenda

- General introduction to MQTT
- MQTT with Node-RED
 - Subscribe data from a public broker
 - Publish data to a public broker
- MQTT with Python
 - Installation of the paho-mqtt library
 - Subscribe data from a public broker
 - Publish data to a public broker
- MQTT in IEC61131 (preview)
- PLCnext Control as MQTT broker
- Q&A

MQTT examples

Required hardware and installations

- PLCnext Control with Node-RED

- Steps for installation via docker:

- <https://www.plcnext-community.net/en/hn-makers-blog/481-node-red-and-getting-started-with-docker.html>

- <https://www.plcnext-community.net/en/hn-makers-blog/482-node-red-with-docker-tips-and-best-practice.html>

- Steps for offline installation:

- <https://www.plcnext-community.net/en/hn-makers-blog/418-install-node-red-and-pm2-offline.html>

MQTT examples

MQTT with Node-RED

Demo

MQTT examples

Example: Publish and subscribe topics in one flow

- **Task:** In this example of a Node-RED flow, a string value should be subscribed and published via MQTT.
- The topic name is: ***MyHome/LivingRoom/Light.***
- The payload string can be: ***“1” or “0”.***

C++ Components

Agenda

- General introduction to MQTT
- MQTT with Node-RED
 - Subscribe data from a public broker
 - Publish data to a public broker
- MQTT with Python
 - Installation of the paho-mqtt library
 - Subscribe data from a public broker
 - Publish data to a public broker
- MQTT in IEC61131 (preview)
- PLCnext Control as MQTT broker
- Q&A

MQTT examples

Installation of paho-mqtt

1) Download the paho-mqtt library: <https://pypi.org/project/paho-mqtt/#files>

2) Transfer the *.tar.gz file to your PLCnext Control, e.g. via WinSCP.

3) Extract the file with the command: `tar -xf paho-mqtt-<version>.tar.gz`

4) Login as root user.

5) Move the source files to the Python3.8 library folder:

```
mv paho-mqtt-<version>/src/paho /usr/lib/python3.8/
```

MQTT examples

Alternative installation of paho-mqtt

- 1) Install the Python package manager PIP as described here:

<https://www.plcnext-community.net/en/hn-makers-blog/425-installing-pip-without-ipkg.html>

- 2) Use the following command to install paho-mqtt via PIP: `pip install paho-mqtt`

MQTT examples

Python code creation

```
1 import paho.mqtt.client as mqtt
2 import time
3 import getpass
4
5 print("\033[1;33;40m \n -----")
6 print("\033[1;36;40m MQTT publisher")
7 print("\033[1;33;40m -----")
8
9
10 # function definition
11 def on_connect(client, userdata,
12 if rc==0:
13     print("\033[1;33;40m Conn
14     print("\033[1;33;40m Conn
15
16
17 # create client
18 client = mqtt.Client()
19
20 # get user input for connection
21 broker_url = str(input("\033[1;37
22 broker_port = int(input("\033[1;3
23
24 user = str(input("\033[1;37;40m Usern
25 pswd = getpass.getpass("\033[1;37
26
27 # try to connect to broker
28 client.username_pw_set(user, pswd)
29 client.connect(broker_url, broker_port,
30 client.on_connect = on_connect
31
32 # repeat subscription until keyboard interrupt
33 while True:
34     try:
35         client.loop_start()
36         time.sleep(1)
37         topic = str(input("\033[1;37;40m Topic: "))
38         qos_level = int(input("\033[1;37;40m QoS : "))
39         retain = bool(input("\033[1;37;40m Retain (True/False) : "))
40         payload = str(input("\033[1;37;40m Message : "))
```

Useful information and examples can be found here, for example:

- <https://pypi.org/project/paho-mqtt/>
- <https://github.com/eclipse/paho.mqtt.python/tree/master/examples>

...

MQTT examples

MQTT with Python

Demo

MQTT examples

The image shows a terminal window titled 'admin@192.168.0.120' with the following output from the script 'Python_MQTT_Client_Test2.py':

```
-----  
MQTT subscriber  
-----  
  
Broker URL : 192.168.0.130  
Port (e.g. 1883) : 1883  
Username : Christiane  
Password :  
Connection successful, Returned Code= 0  
Topic to subscribe : Hello/World  
QoS : 0  
Subscription done  
Waiting for data ...  
  
2020-11-11 10:03:53.337899  
Topic : Hello/World  
Message : b'Yeaaaahhhh'  
  
2020-11-11 10:04:14.177894  
Topic : Hello/World  
Message : b'Hello World 123'
```

Annotations with green arrows point to specific parts of the terminal output:

- Execute the python script**: Points to the command `python3 Python_MQTT_Client_Test2.py` in the terminal prompt.
- Setup the communication to broker**: Points to the configuration lines: `Broker URL : 192.168.0.130`, `Port (e.g. 1883) : 1883`, `Username : Christiane`, and `Password :`.
- Define topic and quality of service level**: Points to the subscription configuration lines: `Topic to subscribe : Hello/World` and `QoS : 0`.
- Value changes will be displayed, incl. time**: Points to the received messages, which include a timestamp, topic, and message: `2020-11-11 10:03:53.337899`, `Topic : Hello/World`, `Message : b'Yeaaaahhhh'`, and `2020-11-11 10:04:14.177894`, `Topic : Hello/World`, `Message : b'Hello World 123'`.

INSPIRING INNOVATIONS

MQTT examples

```
admin@192.168.0.120
root@axcf2152:/opt/plcnext/# python3 Python_MQTT_Client_Test1.py

-----
MQTT publisher
-----

Broker URL : 192.168.0.130
Port (e.g. 1883) : 1883
Username : Christiane
Password :
Connection successful, Returned Code= 0

Topic: Hello/World
QoS : 0
Retain (True/False) : True
Message : Good Day!
Publishing done

Topic: Hello/World
QoS : 1
Retain (True/False) : False
Message : Hello again
Publishing done
```

Execute the python script

Setup the communication to broker

Define topic, QoS, retain and payload

MQTT examples

Mosquitto broker

- lightweight open source message broker
- implements MQTT versions 3.1.0, 3.1.1 and version 5.0
- free of charge for everyone (and business-friendly licensing thanks to EPL/EDL)
- Available for Linux and Windows systems

Documentation: <https://mosquitto.org/documentation/>
Github: <https://github.com/eclipse/mosquitto>

MQTT examples

Installation of the mosquitto broker via docker

- 1) Create a PuTTY session
- 2) Login as root
- 3) Use the following command to install *mosquitto*:

```
balena-engine run -it --name mosquitto -p 1883:1883 eclipse-mosquitto
```

- 4) Restart *balenaEngine*: `/etc/init.d/balena stop`

```
/etc/init.d/balena start
```

- 5) Start *mosquitto*: `balena-engine start mosquitto`

MQTT examples

Creation of a new user

1) Open the container console: `balena-engine exec -it mosquitto /bin/sh`

2) Change to the mosquitto directory: `cd /mosquitto`

3) Create a new password file and your first user:

```
mosquitto_passwd -c passwordfile <Username>
```

4) Enter the password twice (It will be stored within the file in encrypted form)

* To create further users enter: `mosquitto_passwd -b passwordfile <Username> <Password>`

MQTT examples

Make password file known

- 1) Change the directory: `cd /config`
- 2) Open the *mosquitto.conf* file in the *vi* editor: `vi mosquitto.conf`
- 3) Press “G” to jump to the file end (`↑` + `G`)
- 4) Add the following two lines:

```
allow_anonymous false
password_file /mosquitto/passwordfile
```
- 5) Save and close the file with: `Esc` , then `:` + `w` + `q` , then `Enter`
- 6) Close the container console with: `exit`
- 7) Restart the mosquitto broker
